## 12x12 DOTS MATRIX LED DRIVER

January 2022

### GENERAL DESCRIPTION

The IS31FL3747 is a general purpose 12 × n (n=1~12) LED Matrix programmed via 12MHz SPI or 30MHz VSB compatible interface. Each LED can be dimmed individually with 8-bit PWM or 12-bit PWM data and 8-bit DC scaling data which allowing 256 steps or 4096 steps of linear PWM dimming and 256 steps of DC current adjustable level.

Additionally, each LED open and short state can be detected, IS31FL3747 store the open or short information in Open-Short Registers. The Open-Short Registers allowing MCU to read out via VSB or SPI interface, inform MCU whether there are LEDs open or short and the locations of open or short LEDs.

The IS31FL3747 operates from 2.7V to 5.5V and features a very low shutdown and operational current.

IS31FL3747 is available in QFN-40 (5mmx5mm) and WLCSP-36 packages. It operates from 2.7V to 5.5V over the temperature range of -40°C to +125°C.

### FEATURES

- Supply voltage range: 2.7V to 5.5V
- Support 12 × n (n=1~12) LED matrix configurations
- Dual IS31FL3747 cascade connection support 24 × n (n=1~24) LED matrix configurations.
- Individual 12-bit, 8-bit and 8+4-bit PWM control steps
- Individual 8-bit DC current steps
- Global 8-bit current setting
- Maximum 32MHz with spread spectrum (SSP).
- 12MHz SPI or 30MHz VSB
- State lookup registers
- Individual open and short detect function
- 180-degree phase delay operation to reduce power noise
- De-Ghost
- ±7.5% (Max.) at 47.8mA channel to channel matching
- ±4% (Max.) at 47.8mA device to device accuracy
- Operating temperature: -40°C to 125°C
- QFN-40 (5mmx5mm) and WLCSP-36 packages

### APPLICATIONS

- LED display for hand-held devices
- Gaming device (Keyboard, mouse etc.)
- LED in white goods application

### TYPICAL APPLICATION CIRCUIT

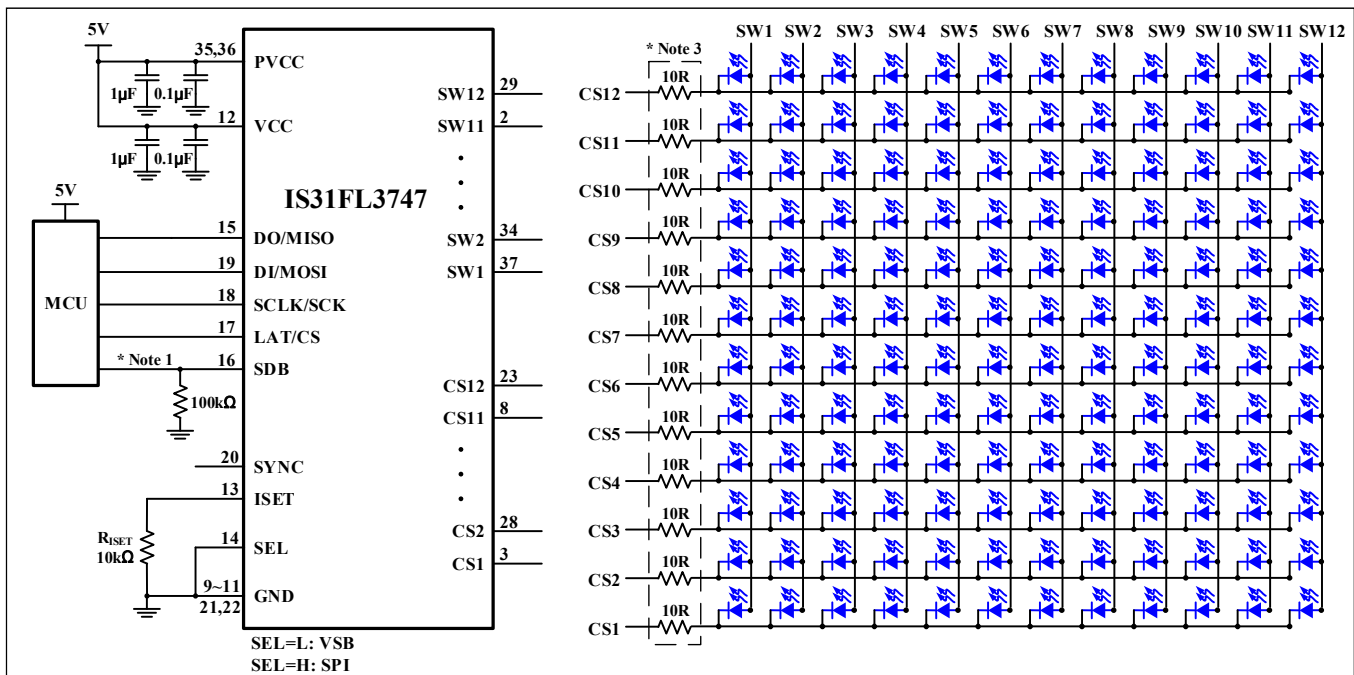

Figure 1 Typical Application Circuit: VSB/SPI Interface, 12x12 Array

# IS31FL3747

## TYPICAL APPLICATION CIRCUIT (CONTINUED)

Figure 2 Typical Application Circuit: VSB/SPI Interface, 48 RGBs

**Note 1:** SDB Logic “1” input voltage is  $0.8V_{CC}$ , if the MCU  $V_{OH}$  is 3.3V, need to connect the SDB pin to 5V.

**Note 2:** PVCC and VCC should use same power supply to avoid the additional  $I_{SD}$ , it is recommended to use  $PV_{CC}=V_{CC}=5V$ .

Figure 3 Typical Application Circuit: VSB Interface, 24x24 Array

## PIN CONFIGURATION

Package	Pin Configuration (Top View)
QFN-40	
WLCSP-36	

# IS31FL3747

## PIN DESCRIPTION (QFN)

No.	Pin	Description
37, 34, 38, 33, 39, 32, 40, 31, 1, 30, 2, 29	SW1~SW12	Power SW.
3, 28, 4, 27, 5, 26, 6, 25, 7, 24, 8, 23	CS1~CS12	Current sink pin for LED matrix.
9~11, 21, 22	GND	Analog GND.
12	VCC	Analog and digital circuits.
13	ISET	Set the maximum IOOUT current.
14	SEL	Select SPI or VSB.
15	DO/MISO	VSB output data / MISO of SPI.
16	SDB	Shutdown pin.
17	LAT/CS	VSB latch / CS of SPI.
18	SCLK/SCK	VSB clock / SPI clock.
19	DI/MOSI	VSB input data / SPI input data.
20	SYNC	Synchronization.
35, 36	PVCC	Power for current source SW.
	Thermal Pad	Need to connect to GND.

## PIN DESCRIPTION (WLCSP)

No.	Pin	Description
A4, A3, C5, B3, A5, A2, A6, A1, B5, B2, B6, B1	SW1~SW12	Power SW.
C4, C3, C6, C1, D4, C2, D5, D2, D6, D1, E4, E2	CS1~CS12	Current sink pin for LED matrix.
E1, E6	GND	Analog GND.
F6	VCC	Analog and digital circuits.
F4	ISET	Set the maximum IOOUT current
F5	SEL	Set SPI or VSB
E5	DO/MISO	VSB output data / MISO of SPI.
F3	SDB	Shutdown pin.
E3	LAT/CS	VSB latch / CS of SPI.
D3	SCLK/SCK	VSB clock / SPI clock.
F2	DI/MOSI	VSB input data / SPI input data.
F1	SYNC	Synchronization.
B4	PVCC	Power for current source SW.

## ABSOLUTE MAXIMUM RATINGS

Supply voltage, $V_{CC}$	-0.3V ~ +6.0V
Voltage at any input pin	-0.3V ~ $V_{CC}+0.3V$
Maximum junction temperature, $T_{JMAX}$	+150°C
Storage temperature range, $T_{STG}$	-65°C ~ +150°C
Operating temperature range, $T_A=T_J$	-40°C ~ +125°C
Package thermal resistance, junction to ambient (4-layer standard test PCB based on JESD 51-2A), $\theta_{JA}$	31°C/W (QFN) 46.8°C/W (WLCSP)
ESD (HBM)	±8kV
ESD (CDM)	±750V

**Note 4:** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

The following specifications apply for  $V_{CC}=5V$ ,  $T_A=25^\circ C$ , unless otherwise noted.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{CC}$	Supply voltage		2.7		5.5	V
$I_{CC}$	Quiescent power supply current	$V_{CC}=5V$ , $V_{SDB}=V_{CC}$ , normal operation, $GCC=0xFF$ , $PWM=0x00$ , $OSC=16MHz$ , $SWx$ Pull Down Voltage= floating, $CSy$ Pull Up Voltage= floating, $C8h$ (Update Register) written “0000 0000”		3.8	5	mA
		$V_{CC}=3.6V$ , $V_{SDB}=V_{CC}$ , normal operation, $GCC=0xFF$ , $PWM=0x00$ , $OSC=16MHz$ , $SWx$ Pull Down Voltage= floating, $CSy$ Pull Up Voltage= floating, $C8h$ (Update Register) written “0000 0000”		2.9	4	mA
$I_{SD}$	Shutdown current	$V_{CC}=5V$ , $V_{SDB}=0V$		2.2	3.0	$\mu A$
		$V_{CC}=5V$ , $V_{SDB}=V_{CC}$ , Configuration Register written “0000 0000”		2.2	3.0	
		$V_{CC}=3.6V$ , $V_{SDB}=0V$		1	1.7	
		$V_{CC}=3.6V$ , $V_{SDB}=V_{CC}$ , Configuration Register written “0000 0000”		1	1.7	
$I_{OUT}$	Maximum constant current of $CSy$	$R_{ISET}=10k\Omega$ , $GCC=0x0FF$ , $SL=0xFF$ , $V_{OUT}=0.6V$	43.5	47.8	52.1	mA
$\Delta I_{OUT}$	$I_{OUT}$ mismatch between channels	$R_{ISET}=10k\Omega$ , $GCC=0xFF$ , $Scaling=0xFF$ (Note 5)	-7.5		7.5	%
$\Delta I_{MAT}$	$I_{OUT}$ accuracy between devices	$R_{ISET}=10k\Omega$ , $GCC=0xFF$ , $Scaling=0xFF$ (Note 6)	-4		4	%

## ELECTRICAL CHARACTERISTICS (CONTINUE)

The following specifications apply for  $V_{CC}=5V$ ,  $T_A=25^{\circ}C$ , unless otherwise noted.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{HR}$	Current switch headroom voltage SWx	$I_{SWITCH}=400mA$ , $R_{ISET}=10k\Omega$ , $GCC=0xFF$ , $SL=0xFF$		200	400	mV
	Current switch headroom voltage SWx (only for QFN-40 Package)	$I_{SWITCH}=800mA$ , $R_{ISET}=10k\Omega$ , $GCC=0xFF$ , $SL=0xFF$		350	650	
	Current sink headroom voltage CSy	$I_{SINK}=47.8mA$ , $R_{ISET}=10k\Omega$		290	510	
$t_{CSON}$	CS-ON time during scan, the CSy are all on during this time	$R_{ISET}=10k\Omega$ , $GCC=0xFF$ , $SL=0xFF$ , $OSC=16MHz$ , 8bit PWM Mode	14.5	17.1	20.5	$\mu s$
		$R_{ISET}=10k\Omega$ , $GCC=0xFF$ , $SL=0xFF$ , $OSC=16MHz$ , 12bit PWM Mode	233	273	313	$\mu s$
$t_{CSOFF}$	CS-OFF time during scan, the CSy are all off during this time	$R_{ISET}=10k\Omega$ , $GCC=0xFF$ , $SL=0xFF$ , $OSC=16MHz$	1.45	1.85	2.25	$\mu s$
$t_{NOL}$	Delay total time for CS1 to CS 12, during this time, the SWx is on but CSy is not all turned on	(Note 7)	0.105	0.125	0.145	$\mu s$
$T_{SD}$	Thermal shutdown	(Note 7)		165		$^{\circ}C$
$T_{SD\_HY}$	Thermal shutdown hysteresis	(Note 7)		20		$^{\circ}C$
$V_{OD}$	LED open detect threshold	$V_{CC}=5V$ , $R_{ISET}=10k\Omega$ , $I_{OUT}\geq 0.1mA$ , measured at CSy	0.065	0.12		V
$V_{SD}$	LED short detect threshold	$V_{CC}=5V$ , $R_{ISET}=10k\Omega$ , $I_{OUT}\geq 0.1mA$ , measured at CSy ( $V_{CC}-V_{CSy}$ )	0.65	0.95		V
<b>Logic Electrical Characteristics (SCLK/SCK, DO/MISO, DI/MOSI, LAT/CS, SDB, SYNC)</b>						
$V_{IL}$	Logic "0" input voltage (SCLK/SCK, DO/MISO, DI/MOSI, LAT/CS, SYNC)	$V_{CC}=2.7V\sim 5.5V$			$V_{CC}\times 0.2$	V
	Logic "0" input voltage (SDB)	$V_{CC}=2.7V\sim 5.5V$			$V_{CC}\times 0.4$	V
$V_{IH}$	Logic "1" input voltage (SCLK/SCK, DO/MISO, DI/MOSI, LAT/CS, SYNC)	$V_{CC}=2.7V\sim 5.5V$	$V_{CC}\times 0.5$			V
	Logic "1" input voltage (SDB)	$V_{CC}=2.7V\sim 5.5V$	$V_{CC}\times 0.8$			V
$V_{OH}$	H level MISO/DO pin output voltage	$I_{OH} = -8mA$	$V_{CC}-0.4V$		$V_{CC}$	V
$V_{OL}$	L level MISO/DO pin output voltage	$I_{OL} = 8mA$	0		0.4	V
$V_{HYS}$	Input Schmitt trigger hysteresis	$V_{CC}=3.6V$ (Note 7)		0.2		V
$I_{IL}$	Logic "0" input current	SDB=L, $V_{INPUT} = L$ (Note 7)		5		nA
$I_{IH}$	Logic "1" input current	SDB=L, $V_{INPUT} = H$ (Note 7)		5		nA

## DIGITAL INPUT SPI SWITCHING CHARACTERISTICS (NOTE 7)

Symbol	Parameter	Min.	Typ.	Max.	Units
f <sub>C</sub>	Clock frequency	-		12	MHz
t <sub>SLCH</sub>	CS active set-up time	34			ns
t <sub>SHCH</sub>	CS not active set-up time	17			ns
t <sub>SHSL</sub>	CS detect time	167			ns
t <sub>CHSH</sub>	CS active hold time	34			ns
t <sub>CHSL</sub>	CS not active hold time	17			ns
t <sub>CH</sub>	Clock high time	34			ns
t <sub>CL</sub>	Clock low time	34			ns
t <sub>CLCH</sub>	Clock rise time			9	ns
t <sub>CHCL</sub>	Clock fall time			9	ns
t <sub>DVCH</sub>	Data in set-up time	7			ns
t <sub>CHDX</sub>	Data in hold time	9			ns
t <sub>SHQZ</sub>	Output disable time			34	ns
t <sub>CLQV</sub>	Clock low to output valid			39	ns
t <sub>CLQX</sub>	Output hold time	0			ns
t <sub>QLQH</sub>	Output rise time			17	ns
t <sub>QLQH</sub>	Output fall time			17	ns

## DIGITAL INPUT VSB SWITCHING CHARACTERISTICS (NOTE 7)

Symbol	Parameter	Min.	Typ.	Max.	Units
f <sub>C</sub>	Clock frequency	-		30	MHz
t <sub>WH0</sub>	SCLK High Pulse duration	10			ns
t <sub>WL0</sub>	SCLK Low Pulse duration	10			ns
t <sub>SU0</sub>	DI to SCLK rising edge Setup time	5			ns
t <sub>SU1</sub>	LAT falling edge to SCLK rising edge	30			ns
t <sub>H0</sub>	SCLK rising edge to DI Hold time	2			ns
t <sub>H1</sub>	SCLK rising edge to LAT rising edge Hold time	5			ns
t <sub>R0</sub>	DO rise time		3	5	ns
t <sub>R1</sub>	DO fall time		3	5	ns
t <sub>D0</sub>	SCLK rising edge to DO recommend delay time		20	30	ns

**Note 5:** I<sub>OUT</sub> mismatch (between channels) is calculated:

$$\Delta I_{MAT} = \left( \frac{I_{OUTn}(n=12)}{\left( \frac{I_{OUT1} + I_{OUT2} + \dots + I_{OUT12}}{12} \right)} - 1 \right) \times 100\%$$

# IS31FL3747

**Note 6:**  $I_{OUT}$  accuracy (between devices) is calculated:

$$\Delta I_{MAX} = \left( \frac{\left( \frac{I_{OUT1} + I_{OUT2} + \dots + I_{OUT12}}{12} - I_{OUT(IDEAL)} \right)}{I_{OUT(IDEAL)}} \right) \times 100\%$$

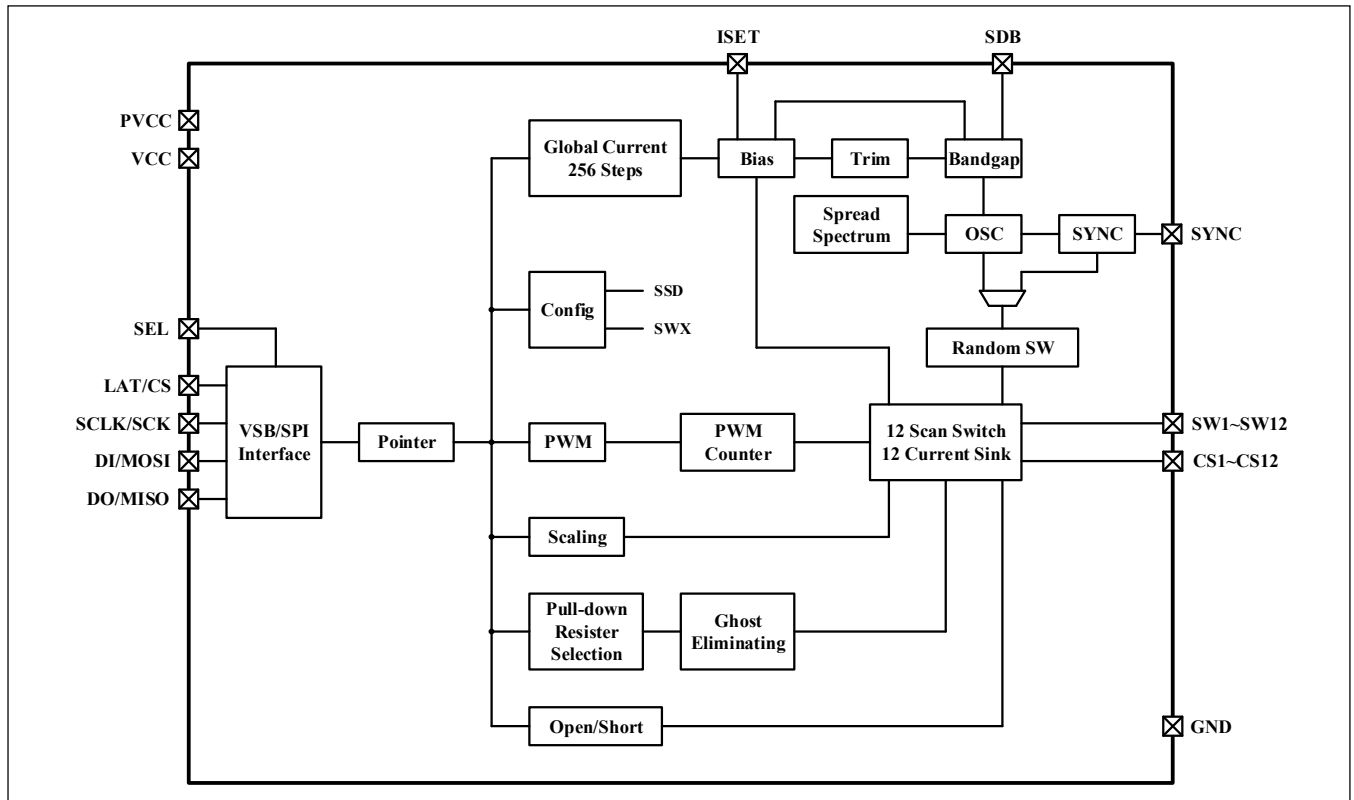

Where  $I_{OUT(IDEAL)} = 47.8\text{mA}$  ( $R_{ISET} = 10\text{k}\Omega$ ,  $GCC = 0xFF$ ,  $Scaling = 0xFF$ ,  $PWM = 0xFF$ ).

**Note 7:** Guaranteed by design.

**Note 8:** The recommended minimum value of  $R_{ISET}$  is  $10\text{k}\Omega$ .

# IS31FL3747

## FUNCTIONAL BLOCK DIAGRAM

# IS31FL3747

## DETAILED DESCRIPTION

### SPI INTERFACE

IS31FL3747 uses a SPI protocol to control the chip's function with four wires: CS, SCK, MOSI and MISO. SPI transfer starts from CS pin from high to low controlled by Master (Microcontroller), and IS31FL3747 latches data when clock rising.

SPI data format is 8-bit length. The first command byte composite of 1-bit R/W bit, 3-bit chip ID bit and 4-bit page bit. The command byte must be sent first, and is followed by register address byte then the register data. If the R/W bit is "0", it will be writing operation and Master (Micro-controller) can write the register data into the register.

The maximum SCK frequency supported in IS31FL3747 is 12MHz.

**Table 1 SPI Command Byte**

Name	R/W	ID bit	Page No.
Bit	D7	D6:D4	D3:D0
Value	0: Write 1: Read	101	0x00: Point to Page 0 0x01: Point to Page 1 0x02: Point to Page 2 0x03: Point to Page 3 0x04: Point to Page 4 0x05: Point to Page 5

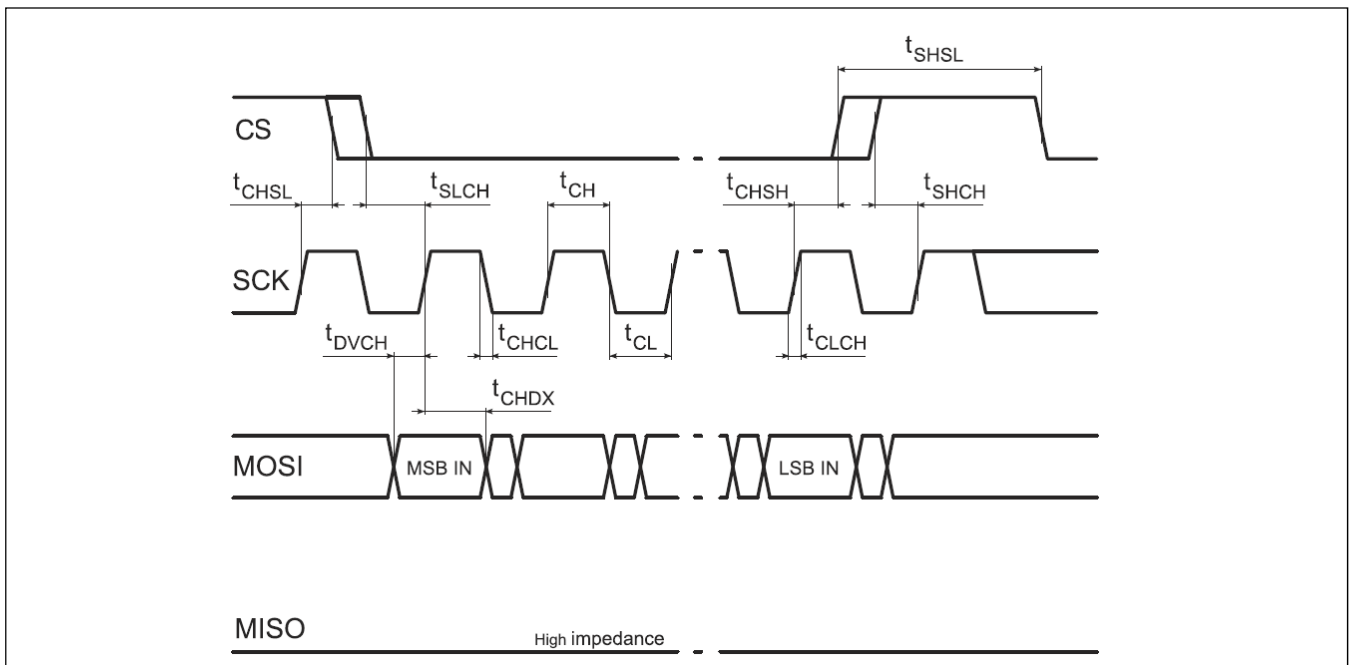

### ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS31FL3747, load the address of the data register that the first data byte is intended for. During the 8<sup>th</sup> rising edge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS31FL3747 will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS31FL3747 (Figure 9).

### READING OPERATION

Page 0~Page 5 registers can be read by SPI.

To read the registers of Page 0 thru Page 5, The D7 of the Command Byte need to be set to "1" and select the page number. If read one register, as shown in Figure 10, read the MISO data after sending the command byte and register address. If read more registers, as shown in Figure 10, the register address will auto increase during the 8<sup>th</sup> rising edge of receiving the last bit of the previous register data.

## SPI Page 0, Page 1, Page 2 (0x50, 0x51, 0x52): PWM Register

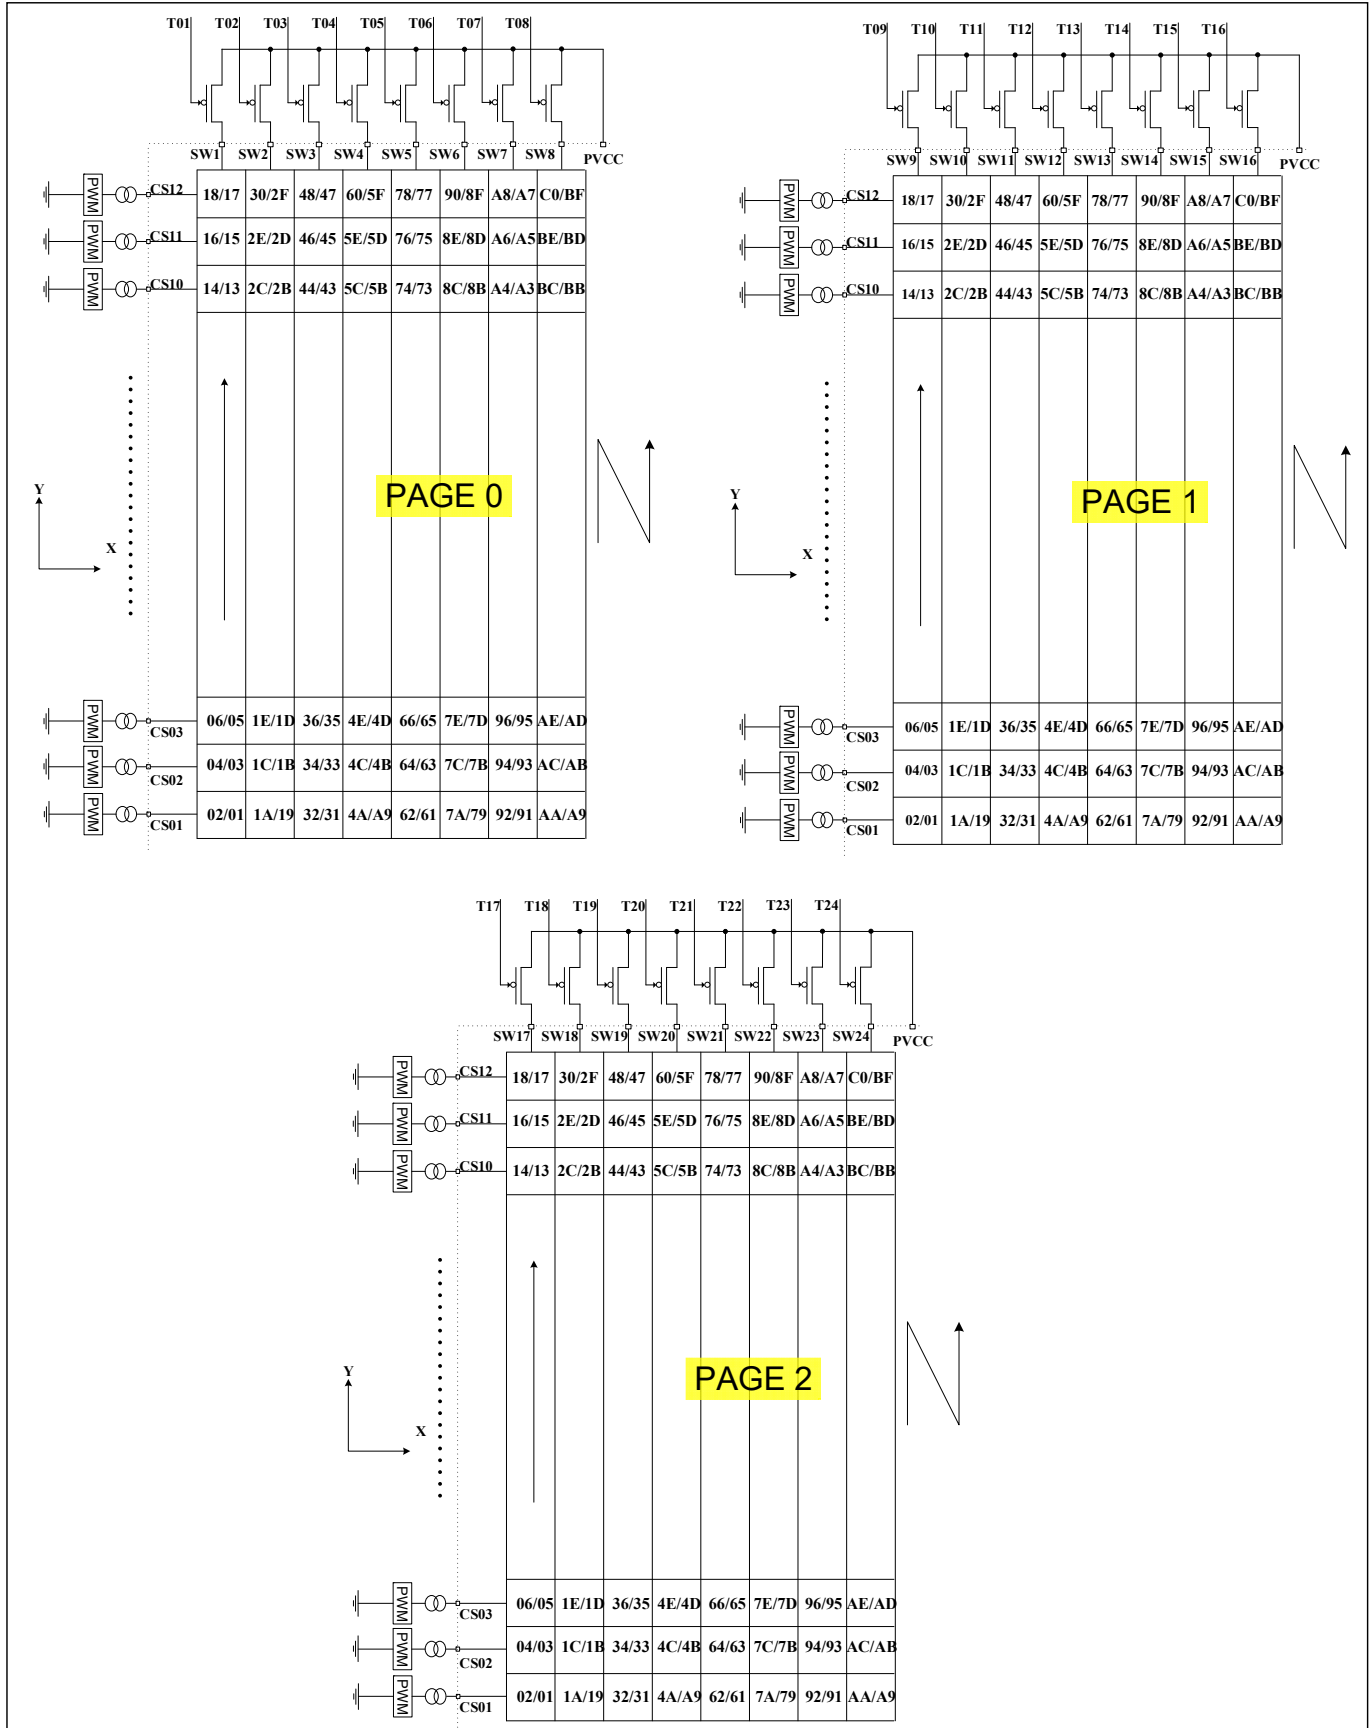

Figure 11 SPI PWM Register

# IS31FL3747

**Table 3 SPI Page 0: 01h ~ C0h PWM Register**

Reg	02h (04h, 06h...)	01h (03h, 05h...)
Bit	D7:D4	D3:D0
Name	-	PWM_H
Default	0000	0000 0000

**Table 4 SPI Page 1: 01h ~ C0h PWM Register**

Reg	02h (04h, 06h...)	01h (03h, 05h...)
Bit	D7:D4	D3:D0
Name	-	PWM_H
Default	0000	0000 0000

**Table 5 SPI Page 2: 01h ~ C0h PWM Register**

Reg	02h (04h, 06h...)	01h (03h, 05h...)
Bit	D7:D4	D3:D0
Name	-	PWM_H
Default	0000	0000 0000

Each dot has a byte to modulate the PWM duty in 256/4096 steps.

The value of the PWM Registers decides the average current of each LED noted  $I_{LED}$ .

$I_{LED}$  computed by Formula (1):

$$I_{LED} = \frac{PWM}{N} \times I_{OUT(PEAK)} \times Duty \quad (1)$$

$$N=256: PWM = \sum_{n=0}^7 D[n] \cdot 2^n \quad (8\text{-bit mode})$$

$$N=4096: PWM = \sum_{n=0}^{11} D[n] \cdot 2^n \quad (12\text{-bit mode})$$

Where Duty is the duty cycle of SWx, see SCANNING TIMING section for more information.

When SWS= "00000" and in 8bits + 4bits dithering/8bit PWM mode (OSC=16MHz), Duty is computed as below:

$$Duty = \frac{17.1\mu s}{(17.1\mu s + 1.85\mu s)} \times \frac{1}{12} = \frac{1}{13.38} \quad (2, 8\text{-bit mode})$$

When SWS= "00000" and in 12-bit PWM mode (OSC=16MHz), Duty is computed as below:

$$Duty = \frac{273\mu s}{(273\mu s + 17.1\mu s)} \times \frac{1}{12} = \frac{1}{12.08} \quad (2, 12\text{-bit mode})$$

$I_{OUT}$  is the output current of CSy (y=1~12),

$$I_{OUT(PEAK)} = \frac{478}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

GCC is the Global Current Control register (Page 5, 02h) value, SL is the Scaling register value as Table 6/Table 7 and  $R_{ISET}$  is the external resistor of ISET pin. D[n] stands for the individual bit value, 1 or 0, in location n.

For example: if in 8-bit PWM mode, PWM register D7:D0=1011 0101 (0xB5, 181), GCC=1111 1111,  $R_{ISET}$ =10k $\Omega$ , SL=1111 1111:

$$I_{LED} = \frac{478}{10k\Omega} \times \frac{255}{256} \times \frac{255}{256} \times \frac{1}{13.38} \times \frac{218}{256}$$

# IS31FL3747

## SPI Page 3, Page 4 (0x53, 0x54): Scaling Register

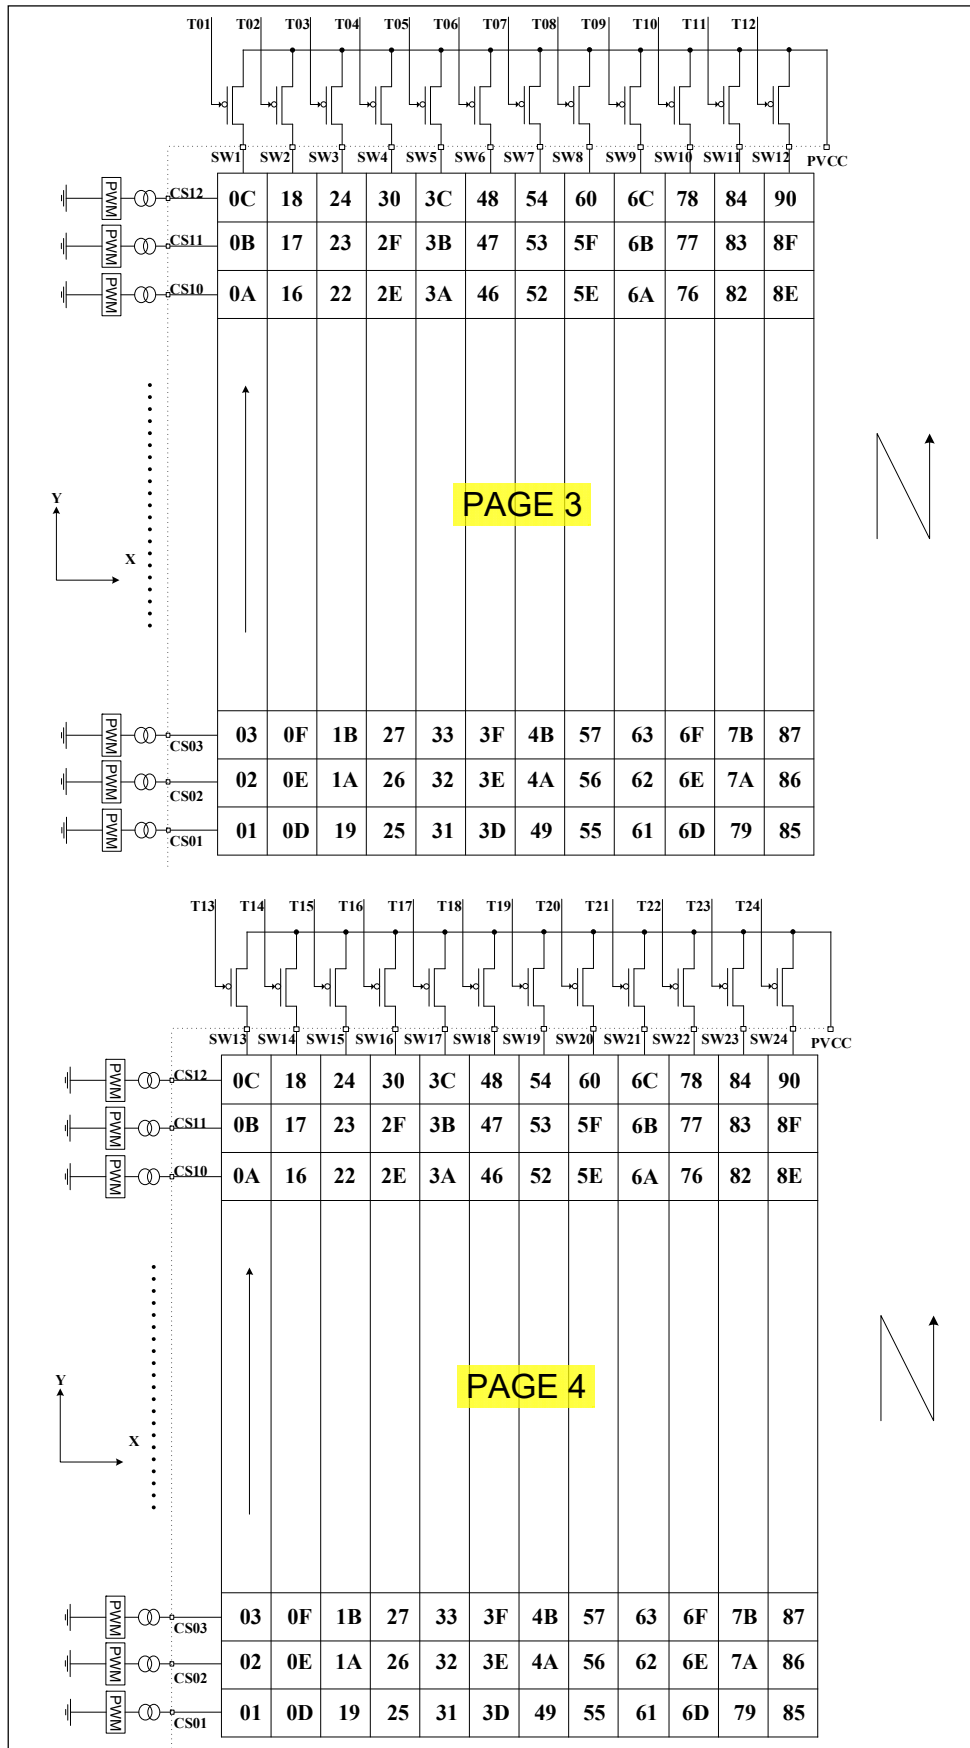

Figure 12 SPI Scaling Register

# IS31FL3747

**Table 6 SPI Page 3: 01h ~ 90h Scaling Register**

Reg	01h (03h, 05h...)
Bit	D7:D0
Name	SL
Default	1111 1111

**Table 7 SPI Page 4: 01h ~ 90h Scaling Register**

Reg	01h (03h, 05h...)
Bit	D7:D0
Name	SL
Default	1111 1111

Scaling Register control the DC output current of each dot. Each dot has a byte to modulate the scaling in 256 steps.

The value of the Scaling Register decides the peak current of each LED noted  $I_{OUT(PEAK)}$ .

$I_{OUT(PEAK)}$  computed by Formula (3):

$$I_{OUT(PEAK)} = \frac{478}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

$$SL = \sum_{n=0}^7 D[n] \times 2^n$$

$I_{OUT}$  is the output current of CSy (y=1~12), GCC is the Global Current Control Register (Page 5, 02h) value and  $R_{ISET}$  is the external resistor of ISET pin. D[n] stands for the individual bit value, 1 or 0, in location n.

For example: if in 8-bit PWM mode,  $R_{ISET}=10k\Omega$ ,  $GCC=1111\ 1111$ ,  $SL=0111\ 1111$ :

$$SL = \sum_{n=0}^7 D[n] \times 2^n = 127$$

$$I_{OUT} = \frac{478}{10k\Omega} \times \frac{255}{256} \times \frac{127}{256} = 23.6mA$$

$$I_{LED} = 23.6mA \times \frac{1}{13.38} \times \frac{PWM}{256}$$

DFh	Reset Register	Reset all registers	-	W	0000 0000

**Table 9 SPI 00h Configuration Register**

Bit	D7	D6	D5	D4:D3	D2:D1	D0
Name	CCS	EPS	OPS	OSC	PMS	SSD
Default	0	1	0	00	00	1

The Configuration Register sets operating mode of IS31FL3747.

When two IS31FL3747 are cascaded, the first chip needs to be set as “chip 1”, and second one as “chip 2”. When CCS is “0”, IS31FL3747 is “chip 1”. When CCS is “1”, IS31FL3747 is “chip 2”. When two IS31FL3747 are cascaded, “chip 1” and “chip 2” must update(C8h) at the same time during initialization.

Set EPS and OPS to change the clock phase of odd channels and even channels. It is helpful for reduction power noise.

The OSC bit selects the oscillator clock frequency. when OSC set “00”, the oscillator clock frequency is 16MHz, when OSC set “01”, the oscillator clock frequency is 32MHz, when OSC set to “10”, the oscillator clock frequency is 8MHz, when OSC set to “11”, the oscillator clock frequency is 4MHz.

The PMS bit selects PWM resolution mode, when PMS set “00”, the PWM mode is 8bits + 4bits dithering, when PFS set to “10”, the PWM mode is 8bits, when PFS set to “01” or “11”, the PWM mode is 12bits.

When SSD is “0”, IS31FL3747 works in software shutdown mode and to normal operate the SSD bit should set to “1”.

**CCS** Cascading Chip Select

- 0 Chip 1
- 1 Chip 2

**EPS** Even Channels Clock Phase Select

- 0 All even channels work as scheme of Clock Phase 1
- 1 All even channels work as scheme of Clock Phase 2

**OPS** Odd Channels Clock Phase Select

 00 8bits + 4bits dithering  
 10 8bits  
 01/11 12bits

**SSD** Software Shutdown Control  
 0 Software shutdown  
 1 Normal operation

**Table 10 SPI 01h SWx Scan & SYNC Function Register**

Bit	D7:D6	D5:D1	D0
Name	SYNC	SWS	RDM
Default	00	00000	0

When SYNC bits are set to “11”, the IS31FL3747 is configured as the master clock source and the SYNC pin will generate a clock signal distributed to the clock slave devices. To be configured as a clock slave device and accept an external clock input the slave device’s SYNC bits must be set to “10”.

SWS control the duty cycle of the SW, default mode is 1/12.

Random SW function is design for get better EMI test results. When RDM set to “1”, SWx will pull up randomly from 12 time points in a scan cycle.

**SYNC** Synchronize Configuration

 Others No allowed

**RDM** Random SW Setting  
 0 Random SW disable  
 1 Random SW enable, not recommend in 24 × n cascade connection (CCS= “1”)

**Table 11 SPI 02h Global Current Control Register**

Bit	D7:D0
Name	GCC
Default	1111 1111

The Global Current Control Register modulates all CSy (y=1~12) DC current which is noted as I<sub>OUT</sub> in 256 steps. I<sub>OUT</sub> is computed by the Formula (3):

$$I_{OUT(PEAK)} = \frac{478}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

$$GCC = \sum_{n=0}^7 D[n] \cdot 2^n$$

Where D[n] stands for the individual bit value, 1 or 0, in location n.

**Table 12 SPI 03h Spread Spectrum & Pull Up /Down Time Register**

Bit	D7	D6	D5	D4	D3:D2	D1:D0
Name	SPT	CPT	SSY	SSP	-	-
Default	0	0	0	0	00	00

Set SPT and CPT to select SW pull down time and CS pull up time.

When SSY enable, spread spectrum frequency will be synchronized with PWM frequency, the LED matrix flick at low current can be solved.

When SSP enable, it will adjust the range (±5%) and cycle time (1980µs) of spread spectrum function.

**SPT** SW Pull Down Time Select  
 0 SW pull down during off time  
 1 SW pull down during de ghost time

**CPT** CS Pull Up Time Select  
 0 CS pull up during off time  
 1 CS pull up during de ghost time

**SSY** Spread Spectrum Synchronize Enable  
 0 SYNC Spread Spectrum disable  
 1 SYNC Spread Spectrum enable

# IS31FL3747

**SSP** Spread Spectrum Enable  
 0 Disable  
 1 Enable

**Table 13 SPI 04h Temperature Status & Open/Short detect & De-ghost Time Register**

Bit	D7	D6:D5	D4:D3	D2:D1	D0
Name	DGT	OSDE	TSP	TROF	TSE
Default	0	00	00	00	0

OSDE enables the open or short LED channel detection with the result stored in 09h~38h, note either open or short information is saved not both.

When TSE are set to "0", the thermal shutdown function enables. If environment temperature higher than maximum safe working temperature, IS31FL3747 will work in shutdown mode automatically, and it will go back in normal operation when the temperature drops.

TSP stores the temperature/thermal roll-off point. TROF stores percentage of output current of the thermal roll-off function.

**DGT** De ghost time select  
 0 35 cycle  
 1 51 cycle

**OSDE** Open/Short Detect Enable  
 00/01 Detect disable

**Table 18 SPI 09h~38h Open/Short detect result Register (Read Only)**

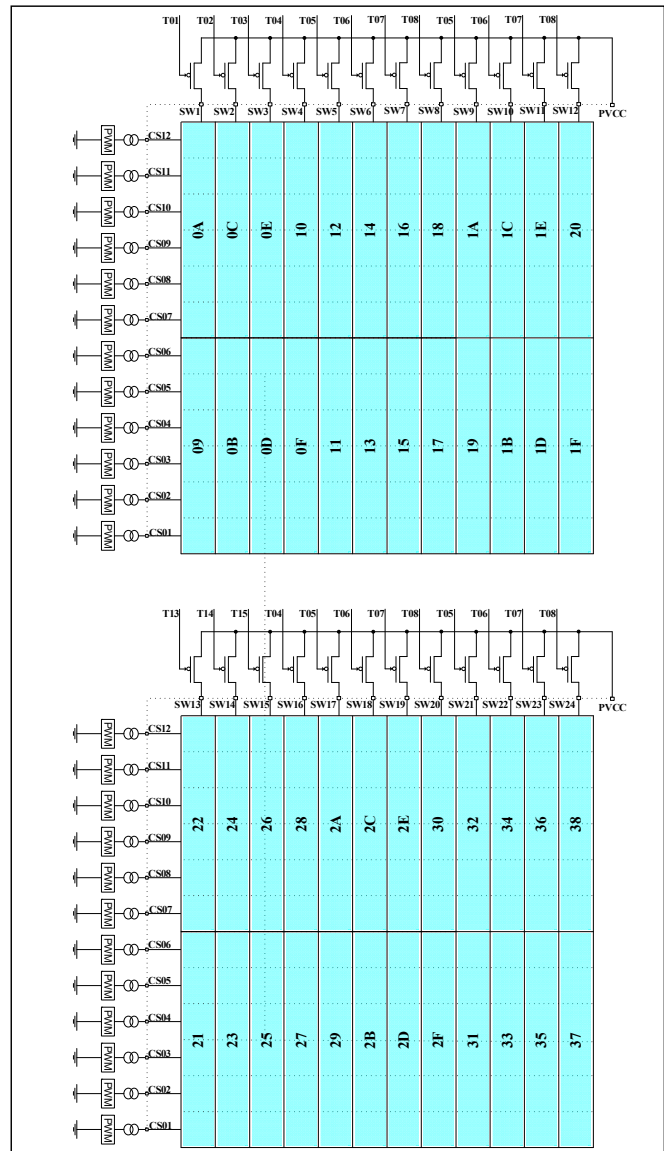

Bit	D7:D6	D5:D0
Name	-	CS06:CS01 of SWx
Default	00	00 0000
Bit	D7:D6	D5:D0
Name	-	CS12:CS07 of SWx
Default	00	00 0000

When OSDE (Page5, 04h) is set to “11”, open detection will be trigger once, and the open information will be stored at 09h~38h.

When OSDE (Page5, 04h) set to “10”, short detection will be trigger once, and the short information will be stored at 09h~38h.

Before set OSDE, the GCC should set to 0x0F, please check OPEN/SHORT DETECT FUNCTION section for more information.

After set OSDE, there should be 1ms delay before reading the open and short operation from registers.

**Figure 13** SPI Open/Short Register

### C8h Update Register

When SDB= “H” and SSD= “1”, a writing of “0000 0000” to C8h will update the PWM register (Page 0/1/2 01h~C0h) values.

### DFh Reset Register

When power on, all registers values are reset to default. A write of “0000 0000” to DFh will also reset all registers to their default values.

# IS31FL3747

## VSB INTERFACE

IS31FL3747 uses a VSB protocol to control the chip's function with four wires: DI, SCLK, LAT and DO. VSB

transfer starts from DI and SCLK controlled by Master (Microcontroller), and IS31FL3747 latches data when LAT set to high.

Figure 14 VSB Input Timing: M0~M71 PWM Register Data Write Command

**Figure 21** VSB Input Timing: FC0h Register Data Read Command

**Figure 22** VSB Input Timing: FC1h Register Data Read Command

# IS31FL3747

**Table 19 VSB Protocol**

Command name	SCLK rising edges when LAT is high	Description
WRT_PWM (48-bit PWM data write)	1	The 48-bit data in the common shift register are copied to the PWM memory unit selected by channel address counter, SW write counter.
UPDATE (Update PWM Data)	3	The 48-bit data is update PWM Register signal. When SDB= "H" and SSD= "1" and this command is received (all data are set to 0.) will update the PWM register (M0~M7) values.
WRT_SL (48-bit SL data write)	5	The 48-bit data in the common shift register are copied to the SL memory unit selected by channel address counter, SW write counter.
WRT_FC (FC data write)	7	The lower 39-bit data or the lower 29-bit data in the common shift register are copied to the FC0 or FC1 register. Bit 47–44 of the common shift register are used to choose which FC register is written to. If "1010b" is received for bit 47–44 of the common shift register, then the lower 44-bits in the common shift register are copied to the FC0 register. If "0101b" is received for bit 47–44 of the common shift register, then the lower 37 bits in the common shift register are copied to the FC1 register. If "11001b" is received for bit 47–43 of the common shift register, all the registers will be reset.
Quit read mode	8	The 48-bit data is quit read mode. When this command is received (all counters are reset to 0.) will quit read mode and return to write mode.
READ_OSD0 (OSD0 data read)	9	The 48-bit OSD0 data are copied to the 48-bit shift register. The loaded data can be read out from DI synchronized with the SCLK rising edge.
READ_OSD1 (OSD1 data read)	10	The 48-bit OSD1 data are copied to the 48-bit shift register. The loaded data can be read out from DI synchronized with the SCLK rising edge.
READ_OSD2 (OSD2 data read)	11	The 48-bit OSD2 data are copied to the 48-bit shift register. The loaded data can be read out from DI synchronized with the SCLK rising edge.
READ_OSD3 (OSD3 data read)	12	The 48-bit OSD3 data are copied to the 48-bit shift register. The loaded data can be read out from DI synchronized with the SCLK rising edge.
READ_OSD4 (OSD4 data read)	13	The 48-bit OSD4 data are copied to the 48-bit shift register. The loaded data can be read out from DI synchronized with the SCLK rising edge.
READ_OSD5 (OSD5 data read)	14	The 48-bit OSD5 data are copied to the 48-bit shift register. The loaded data can be read out from DI synchronized with the SCLK rising edge.
READ_FC0 (FC0 data read)	15	The 44-bit data in the FC0 register are copied to the lower 44 bits of the shift register. Other bits in the shift register are reset to 0. The loaded data can be read out from DI synchronized with the SCLK rising edge.
READ_FC1 (FC1 data read)	16	The 32-bit data in the FC1 register are copied to the lower 32 bits of the shift register. Other bits in the shift register are reset to 0. The loaded data can be read out from DI synchronized with the SCLK rising edge.
FCWRTEEN (FC write enable)	19	FC writes are enabled by this command (all date is set to 0). This command must always be input before the FC data write occurs.

## VSB M0~M71: PWM Register

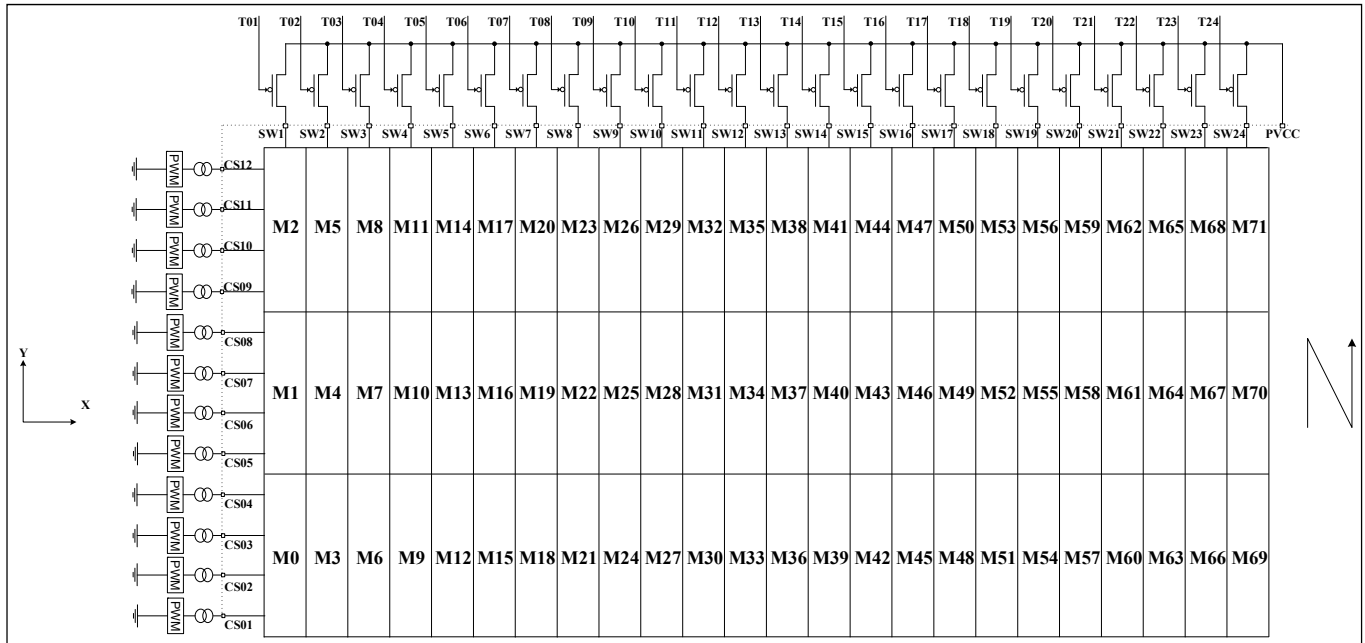

Figure 23 VSB PWM Register

Table 21 VSB M0 ~ M71 Unit

Unit	M0 (M1, M2...M71)				
Bit	47:44	43:36	...	11:8	7:0
Name	PWM_H	PWM_L	...	PWM_H	PWM_L
Default	0000	0000 0000	...	0000	0000 0000

Each dot has a byte to modulate the PWM duty in 256/4096 steps.

The value of the PWM Registers decides the average current of each LED noted  $I_{LED}$ .

$I_{LED}$  computed by Formula (1):

$$I_{LED} = \frac{PWM}{N} \times I_{OUT(PEAK)} \times Duty \quad (1)$$

$$N=256: PWM = \sum_{n=0}^7 D[n] \cdot 2^n \quad (8\text{-bit mode})$$

$$N=4096: PWM = \sum_{n=0}^{11} D[n] \cdot 2^n \quad (12\text{-bit mode})$$

Where Duty is the duty cycle of SW<sub>x</sub>, see SCANNING TIMING section for more information.

When SWS= "00000" and in 8-bits + 4bits dithering/ 8-bit PWM mode (OSC=16MHz), Duty is computed as below:

$$Duty = \frac{17.1\mu s}{(17.1\mu s + 1.85\mu s)} \times \frac{1}{12} = \frac{1}{13.38} \quad (2, 8\text{-bit mode})$$

When SWS= "00000" and in 12-bit PWM mode (OSC=16MHz), Duty is computed as below:

$$Duty = \frac{273\mu s}{(273\mu s + 17.1\mu s)} \times \frac{1}{12} = \frac{1}{12.08} \quad (2, 12\text{-bit mode})$$

$I_{OUT}$  is the output current of CS<sub>y</sub> (y=1~12),

$$I_{OUT(PEAK)} = \frac{478}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

GCC is the Global Current Control register (FC0 Unit (23:16)) value, SL is the Scaling register value as Table 4 and  $R_{ISET}$  is the external resistor of ISET pin. D[n] stands for the individual bit value, 1 or 0, in location n.

For example: if in 8-bit PWM mode, PWM register D7:D0=1011 0101 (0xB5, 181), GCC=1111 1111,  $R_{ISET}$ =10kΩ, SL=1111 1111:

$$I_{LED} = \frac{478}{10k\Omega} \times \frac{255}{256} \times \frac{255}{256} \times \frac{1}{13.38} \times \frac{218}{256}$$

# IS31FL3747

## VSB S0~S47: Scaling Register

Figure 24 VSB Scaling Register

Table 22 VSB S0 ~ S47 Unit

Unit	S0 (S1, S2...S47)				
Bit	47:40	39:32	...	15:8	7:0
Name	SL	SL	...	SL	SL
Default	1111 1111	1111 1111	...	1111 1111	1111 1111

Scaling register control the DC output current of each dot. Each dot has a byte to modulate the scaling in 256 steps.

The value of the Scaling Register decides the peak current of each LED noted  $I_{OUT(PEAK)}$ .

$I_{OUT(PEAK)}$  computed by Formula (3):

$$I_{OUT(PEAK)} = \frac{478}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

$$SL = \sum_{n=0}^7 D[n] \times 2^n$$

$I_{OUT}$  is the output current of  $CS_y$  ( $y=1\sim 12$ ),  $GCC$  is the Global Current Control Register (FC0 Unit (23:16)) value and  $R_{ISET}$  is the external resistor of ISET pin.  $D[n]$  stands for the individual bit value, 1 or 0, in location  $n$ .

For example: if in 8-bit PWM mode,  $R_{ISET}=10k\Omega$ ,  $GCC=1111\ 1111$ ,  $SL=0111\ 1111$ :

$$SL = \sum_{n=0}^7 D[n] \times 2^n = 127$$

$$I_{OUT} = \frac{478}{10k\Omega} \times \frac{255}{256} \times \frac{127}{256} = 23.6mA$$

$$I_{LED} = 23.6mA \times \frac{1}{13.38} \times \frac{PWM}{256}$$

**Table 24 VSB FC0 Unit (7:0) Configuration Register**

Bit	7	6	5	4:3	2:1	0
Name	CCS	EPS	OPS	OSC	PMS	SSD
Default	0	1	0	00	00	1

The Configuration Register sets operating mode of IS31FL3747.

When two IS31FL3747 are cascaded, the first chip needs to be set as “chip 1”, and second one as “chip 2”. When CCS is “0”, IS31FL3747 is “chip 1”. When CCS is “1”, IS31FL3747 is “chip 2”.

Set EPS and OPS to change the clock phase of odd channels and even channels. It is helpful for reduction power noise.

The OSC bit selects the oscillator clock frequency. when OSC set “00”, the oscillator clock frequency is 16MHz, when OSC set “01”, the oscillator clock frequency is 32MHz, when OSC set to “10”, the oscillator clock frequency is 8MHz, when OSC set to “11”, the oscillator clock frequency is 4MHz.

The PMS bit selects PWM resolution mode, when PMS set “00”, the PWM mode is 8bits + 4bits dithering, when

PFS set to “10”, the PWM mode is 8bits, when PFS set to “01” or “11”, the PWM mode is 12bits.

When SSD is “0”, IS31FL3747 works in software shutdown mode and to normal operate the SSD bit should set to “1”.

**CCS** Cascading Chip Select

- 0 Chip 1

Bit	15:14	13:9	8
Name	SYNC	SWS	RDM
Default	00	00000	0

When SYNC bits are set to "11", the IS31FL3747 is configured as the master clock source and the SYNC pin will generate a clock signal distributed to the clock slave devices. To be configured as a clock slave device and accept an external clock input the slave device's SYNC bits must be set to "10".

SWS control the duty cycle of the SW, default mode is 1/12.

Random SW function is design for get better EMI test results. When RDM set to "1", SWx will pull up randomly from 12 time points in a scan cycle.

**Table 26 VSB FC0 Unit (23:16) Global Current Control Register**

Bit	23:16
Name	GCC
Default	1111 1111

The Global Current Control Register modulates all CSy (y=1~12) DC current which is noted as I<sub>OUT</sub> in 256 steps. I<sub>OUT</sub> is computed by the Formula (3):

$$I_{OUT(PEAK)} = \frac{478}{R_{ISET}} \times \frac{GCC}{256} \times \frac{SL}{256} \quad (3)$$

$$GCC = \sum_{n=0}^7 D[n] \cdot 2^n$$

Where D[n] stands for the individual bit value, 1 or 0, in location n.

**Table 27 VSB FC0 Unit (31:24) Spread Spectrum & Pull Up /Down Time Register**

Bit	31	30	29	28	27:26	25:24
Name	SPT	CPT	SSY	SSP	-	-
Default	0	0	0	0	00	00

Set SPT and CPT to select SW pull down time and CS pull up time.

When SSY enable, spread spectrum frequency will be synchronized with PWM frequency, the LED matrix flick at low current can be solved.

When SSP enable, it will adjust the range (±5%) and cycle time (1980µs) of spread spectrum function.

**SPT** SW Pull Down Time Select  
 0 SW pull down during off time  
 1 SW pull down during de-ghost time

# IS31FL3747

**CPT** CS Pull Up Time Select  
 0 CS pull up during off time  
 1 CS pull up during de-ghost time

**SSY** Spread Spectrum Synchronize Enable

Bit	47:42	41:36
Name	CS12:CS7 of SWx+4	CS06:CS1 of SWx+4
Default	0000 00	00 0000

When OSDE (FC0 Unit (39:32)) is set to “11”, open detection will be trigger once, and the open information will be stored at OSD0~OSD5 Unit (47:0).

When OSDE (FC0 Unit (39:32)) set to “10”, short detection will be trigger once, and the short information will be stored at OSD0~OSD5 Unit (47:0).

Before set OSDE, the GCC should set to 0x0F, please check OPEN/SHORT DETECT FUNCTION section for more information.

After set OSDE, there should be 1ms delay before reading the open and short operation from registers.

**Figure 25** VSB Open/Short Register

### Update Register

When SDB= “H” and SSD= “1”, a write of 48-bit data (all data are set to 0) to Update register will update the PWM register (M0~M71) values.

### Reset Register

When power on, all registers values are reset to default. And write of “11001b” (bit 47~43) to FC register will also reset all registers to their default values.

# IS31FL3747

## APPLICATION INFORMATION

Figure 26 Scanning Timing (8-bit PWM Mode)

### SCANNING TIMING

As shown in Figure above, the SW1~SW12 is turned on by serial, LED is driven 12 by 12 within the SW<sub>x</sub> (x=1~12) on time (SW<sub>x</sub>, x=1~12 is source and it is high when LED on), including the non-overlap blanking time during scan, the duty cycle of SW<sub>x</sub> (active high, x=1~12) is:

$$Duty = \frac{17.1\mu s}{(17.1\mu s + 1.85\mu s)} \times \frac{1}{12} = \frac{1}{13.38} \quad (2, 8\text{-bit mode})$$

Where 17.1 μs is t<sub>CSON</sub>, 1.85 μs is t<sub>CSOFF</sub>.

### PWM CONTROL

After setting the I<sub>OUT</sub> and GCC, the brightness of each LEDs (LED average current (I<sub>LED</sub>)) can be modulated with 256 steps by PWM Register, as described in Formula (1).

$$I_{LED} = \frac{PWM}{N} \times I_{OUT(PEAK)} \times Duty \quad (1)$$

$$N=256: PWM = \sum_{n=0}^7 D[n] \cdot 2^n \quad (8\text{-bit mode})$$

$$N=4096: PWM = \sum_{n=0}^{11} D[n] \cdot 2^n \quad (12\text{-bit mode})$$

Where PWM is PWM Registers data showing in SPI INTERFACE Table 3/4/5 or VSB INTERFACE Table 3.

For example, if in 8-bit PWM mode, R<sub>ISET</sub>= 10kΩ, PWM= 127, and GCC= 255, Scaling= 255, then

$$I_{OUT(PEAK)} = \frac{478}{10k\Omega} \times \frac{127}{256} \times \frac{255}{256} \times \frac{255}{256} = 23.5mA$$

$$I_{LED} = 23.5mA \times \frac{1}{13.38} \times \frac{PWM}{256}$$

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

### GAMMA CORRECTION

In order to perform a better visual LED breathing effect we recommend using a gamma corrected PWM value to set the LED intensity. This results in a reduced number of steps for the LED intensity setting, but causes the change in intensity to appear more linear to the human eye.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of display. Since the IS31FL3747 can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye's brightness curve.

# IS31FL3747

**Table 32 Gamma Steps With 256 PWM Steps**

C(0)	C(1)	C(2)	C(3)	C(4)	C(5)	C(6)	C(7)

161	173	186	199	212	226	240	255

**Figure 27** Gamma Correction (32 Steps)

Choosing more gamma steps provides for a more continuous looking breathing effect. This is useful for very long breathing cycles. The recommended configuration is defined by the breath cycle T. When T=1s, choose 32 gamma steps with 256 PWM steps, when T=2s, choose 64 gamma steps with 256 PWM steps, when T=24s, choose 128 gamma steps with 4096 PWM steps. The user must decide the final number of gamma steps not only by the LED itself, but also based on the visual performance of the finished product.

**Figure 29** Gamma Correction (128 Steps)

**Note 9:** The data of 32 gamma steps is the standard value and the data of 64 gamma steps and 128 gamma steps is the recommended value.

## OPERATING MODE

IS31FL3747 can only operate in PWM Mode. The brightness of each LED can be modulated with 256 steps by PWM registers. For example, if the data in PWM Register is “0000 0100”, then the PWM is the fourth step.

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

## OPEN/SHORT DETECT FUNCTION

IS31FL3747 has open and short detect bit for each LED.

By setting the OSDE bits of the Open/Short Register from “00” to “10” or “11”, the LED Open/Short Register will start to store the open/short information and after at least 2 scanning cycles and the MCU can get the open/short information by reading the 09h~38h, for those dots are turned off via LED Scaling Registers, the open/short data will not get refreshed when setting the OSDE bit of the Open/Short Register.

The two configurations need to set before setting the OSD bits:

- 1 0x0F ≤ GCC ≤ 0x40
- 2 SWx Pull Down Voltage = floating,  
CSy Pull Up Voltage = floating,

Where GCC is the Global Current Control Register and the Pull Down/Up Voltage Selection Register set to 0x00 is set SWx pull-down voltage and CSy pull-up voltage to floating.

The detect action is one-off event and each time before reading out the open/short information, the OSDE bit of the Open/Short Register need to be set from “00” to “01” or “11” (clear before set operation).

## DE-GHOST FUNCTION

The “ghost” term is used to describe the behavior of an LED that should be OFF but instead glows dimly when another LED is turned ON. A ghosting effect typically can occur when multiplexing LEDs. In matrix architecture any parasitic capacitance found in the constant-current outputs or the PCB traces to the LEDs may provide sufficient current to dimly light an LED to create a ghosting effect.

To prevent this LED ghost effect, the IS31FL3747 has integrated Pull down voltage for each SWx (x=1~12) and Pull up voltage for each CSy (y=1~12). Select the right SWx Pull down voltage and CSy Pull up voltage which eliminates the ghost LED for a particular matrix layout configuration.

Typically, selecting the 1.4V (V<sub>CC</sub>-1.4V) will be sufficient to eliminate the LED ghost phenomenon.

# IS31FL3747

When IS31FL3747 works in hardware shutdown mode, the de-ghost function should be disabled, otherwise it will be extra about  $1\mu\text{A}$  shutdown current.

## SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

### Software Shutdown

By setting SSD bit of the Configuration Register to "0", the IS31FL3747 will operate in software shutdown mode. When the IS31FL3747 is in software shutdown, all current sources are switched off, so that the matrix is blanked. All registers can be operated. Typical current consume is  $2.2\mu\text{A}$  when  $V_{CC}=5\text{V}$ .

### Hardware Shutdown

The chip enters hardware shutdown when the SDB pin is pulled low. All analog circuits are disabled during hardware shutdown, typical the current consume is  $2.2\mu\text{A}$  when  $V_{CC}=5\text{V}$ .

The chip releases hardware shutdown when the SDB pin is pulled high. During hardware shutdown state Function Register can be operated.

If  $V_{CC}$  has risk drop below  $1.75\text{V}$  but above  $0.1\text{V}$  during SDB pulled low, please re-initialize all Function Registers before SDB pulled high.

## LAYOUT

As described in external resistor ( $R_{\text{SET}}$ ), the chip consumes lots of power. Please consider below factors when layout the PCB.

1. The  $V_{CC}$  (PVCC, VCC) capacitors need to close to the chip and the ground side should well connected to the GND of the chip.
2.  $R_{\text{SET}}$  should be close to the chip and the ground side should well connect to the GND of the chip.
3. The thermal pad should connect to ground pins and the PCB should have the thermal pad too, usually this pad should have 16 or 25 via thru the PCB to other side's ground area to help radiate the heat. About the thermal pad size, please refer to the land pattern of each package.
4. The CSy pins maximum current is  $47.8\text{mA}$  ( $R_{\text{SET}}=10\text{k}\Omega$ ), and the SWx pins maximum current is larger, the width of the trace, SWx should have wider trace than CSy.

# IS31FL3747

## CLASSIFICATION REFLOW PROFILES

Profile Feature	Pb-Free Assembly
<b>Preheat &amp; Soak</b> Temperature min (T <sub>smin</sub> ) Temperature max (T <sub>smax</sub> ) Time (T <sub>smin</sub> to T <sub>smax</sub> ) (t <sub>s</sub> )	150°C 200°C 60-120 seconds
Average ramp-up rate (T <sub>smax</sub> to T <sub>p</sub> )	3°C/second max.
Liquidous temperature (T <sub>L</sub> ) Time at liquidous (t <sub>L</sub> )	217°C 60-150 seconds
Peak package body temperature (T <sub>p</sub> )*	Max 260°C
Time (t <sub>p</sub> )** within 5°C of the specified classification temperature (T <sub>c</sub> )	Max 30 seconds
Average ramp-down rate (T <sub>p</sub> to T <sub>smax</sub> )	6°C/second max.
Time 25°C to peak temperature	8 minutes max.

## PACKAGE INFORMATION

### QFN-40

# IS31FL3747

## WLCSP-36

# IS31FL3747

## RECOMMENDED LAND PATTERN

### QFN-40

### WLCSP-36

**Note:**

1. Land pattern complies to IPC-7351.
2. All dimensions in MM.
3. This document (including dimensions, notes & specs) is a recommendation based on typical circuit board manufacturing parameters. Since land pattern design depends on many factors unknown (eg. User's board manufacturing specs), user must determine suitability for use.

## REVISION HISTORY

Revision	Detail Information	Date
A	Initial release	2021.09.08
B	1.Update EC table 2.Update Typical Application Circuit 3.Add WLCSP-36 package	2021.12.01
