

IS32SE5118A

8-CH PROGRAMMABLE CAPACITIVE TOUCH SENSOR

General Description

IS32SE5118A is an ultra-low power, 8-channel capacitive touch controller. The controller allows sleep mode and uses auto-detection for wakeup. It also provides a shield output to increase moisture immunity. The built-in hardware monitor and calibration for the environment feature is to prevent false triggers.

A host MCU is required to communicate with IS32SE5118A. An on-chip I²C slave controller with 400kHz capability serves as the communication port for the host MCU. An interrupt, INT, can be configured and it is generated when a touch trigger event occurs. Trigger conditions can be configured by setting the interrupt register. IS32SE5118A can support proximity sensing.

IS32SE5118A is available in TSSOP-16 and wettable flank QFN-16 package. It operates from 2.35V to 5.5V over the temperature range from -40°C to +125°C.

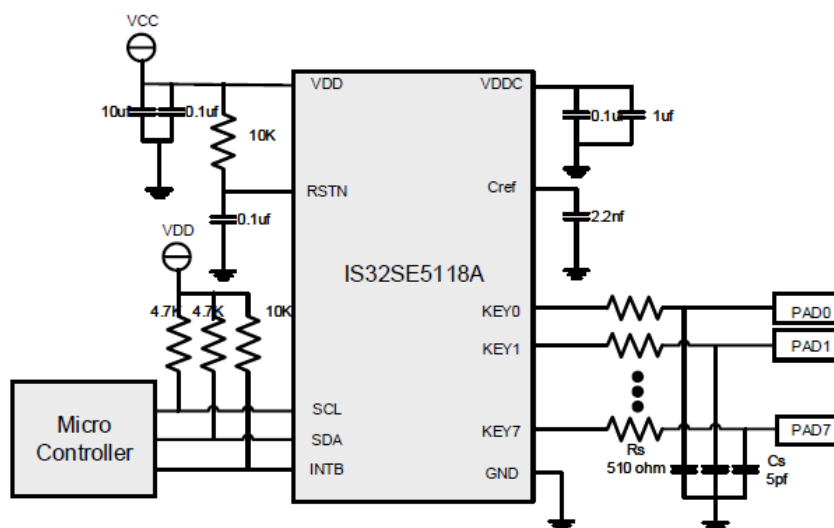

Applications

- Touch keys for home appliances
- Touch keys for industrial control

Features

- 8-channel capacitive touch controller with readable key value
- Touch threshold setting for individual key
- Optional multiple-key function
- Individual key calibration
- Interrupt output with auto-clear and repeating
- Auto sleep mode for extremely low power
- Keys wake up from sleep mode
- Buzzer/Melody Generator
- 400kHz fast-mode I²C interface
- Operating temperature between -40°C to +125°C
- TSSOP-16 and wettable flank QFN-16 (WQFN-16) package
- ROHS & Halogen-Free compliant package
- AEC-Q100 qualification
- TSCA compliance

Typical Application Circuit (TSSOP-16)

Note 1: SE5118A should be placed far away from the noise source for EMS.

Note 2: R_S and C_S should be placed as close to the chip as possible to reduce EMI.

Note 3: INT can be configured as a POW pin for melody application.

Note 4: The capacitors connected to VDD and VDDC should be as close to the chip as possible to reduce EMI.

4. Function Block Diagram

Figure 4-1 Functional Block Diagram

4.1 Basic introduction for touch sense data process flow

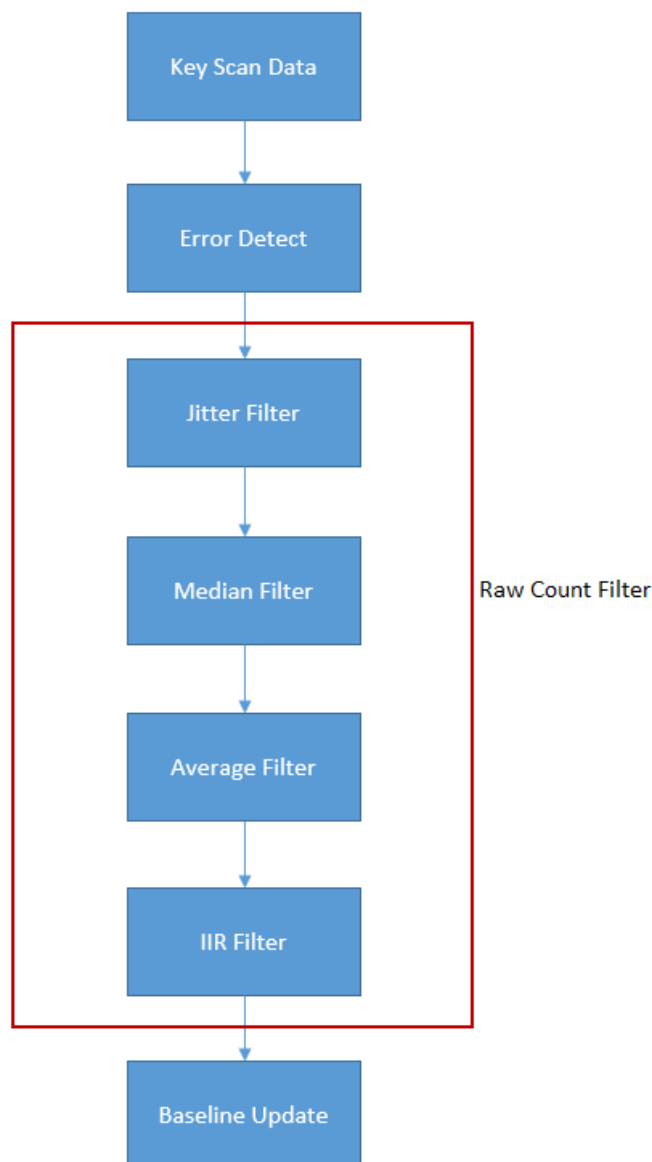

Figure 4-2 Touch Sense Data Process Flow

Baseline will be updated to the current raw count based on the below factors. For detailed information about baseline, please refer to Section 4.4.2 Key parameter in “IS31SE5118A Eval Board User’s Manual” application note.

IS32SE5118A

4.1.1 Positive noise threshold

Baseline is updated if the difference count of baseline count and raw count is below the positive noise threshold.

4.1.2 Negative noise threshold

It is used with the low baseline reset count to reset baseline count to the current raw count. Please refer to the description of Low baseline reset.

4.1.3 Low baseline reset

Low baseline reset count of each key. A reset count increases one if the absolute $|\text{raw count} - \text{baseline}| >$ negative noise threshold. Once the reset count exceeds the low baseline reset register value, the baseline is reset to the current raw count. The reset count will be reset to 0 if the absolute $|\text{raw count} - \text{baseline}| \leq$ negative noise threshold.

5. Detailed Description

5.1 I²C Interface

IS32SE5118A uses a serial bus, which conforms to the I²C protocol, to control the chip's functions with two wires: SCL and SDA. IS32SE5118A has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 "0" for a write command and set A0 "1" for a read command.

The complete slave address is:

Bit	A7:A1	A0
Value	0111100	1/0

The SCL line is uni-directional. The SDA line is bi-directional (open collector) with a pull-up resistor (typically 4.7kΩ). The maximum clock frequency specified by the I²C standard is 400kHz. During communication, the microcontroller is the master and IS32SE5118A is the slave.

The timing diagram for the I²C is shown in Figure 5-1. The SDA is latched on to the stable high level of the SCL. When there is no bus activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I²C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next and most significant bit first. Each address bit must be ready while the SCL level is high.

After the last bit of the chip address is sent, the master checks for IS32SE5118A's acknowledge. The master releases the SDA line high (through a pull-up resistor), and sends an SCL pulse. If IS32SE5118A has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS32SE5118A, the register address byte is sent and most significant bit first. IS32SE5118A must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, and most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, IS32SE5118A must generate another acknowledgement to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

5.2 Reading Port Registers

To read the device data, the bus master must first send the address of IS32SE5118A with the R/W bit set to "0", followed by the register address byte, which determines which register is accessed. After a restart, the bus master must send IS32SE5118A address with the R/W bit set to "1". Data from the register defined by the command byte is sent from IS32SE5118A to the master (Figure 5-4).

Bit	D7:D0
Name	KEYx_BASELINE[7:0]
Default	0000 0000

KEYx_Baseline Baseline of each key

31h~38h KEY0~KEY7 Finger Threshold Register (RW)

Bit	D7:D0
Name	KEYx_TH[7:0]
Default	0101 0000

KEYx_TH Finger threshold of each key. It is used with hysteresis to determine the key state.

IS32SE5118A

39h~40h KEY0~KEY7 Noise Threshold Register (RW)

Bit	D7:D0
Name	KEYx_NTH[7:0]
Default	0010 1000

KEYx_NTH Noise threshold of each key
Baseline needs to be updated if the difference (baseline and raw count) is less than the noise threshold.

41h~48h KEY0~KEY7 Negative Noise Threshold Register (RW)

Bit	D7:D0
Name	KEYx_NNTH[7:0]
Default	0010 1000

KEYx_NNTH Negative noise threshold of each key

49h~50h KEY0~KEY7 Low Baseline Reset Register (RW)

Bit	D7:D0
Name	RCx[7:0]
Default	0001 1110

RCx Reset Count
Low baseline reset count of each key. A reset count increases one if the absolute $|\text{raw count} - \text{baseline}| > \text{absolute} |\text{negative noise threshold}|$. Once the reset count exceeds the low baseline register value, the baseline is reset to the current raw count. The reset count will be reset to 0 if the absolute $|\text{raw count} - \text{baseline}| \leq \text{absolute} |\text{negative noise threshold}|$.

51h~58h KEY0~KEY7 Hysteresis Register (RW)

Bit	D7:D0
Name	HYSTERESISx[7:0]
Default	0000 1010

HYSTERESISx Hysteresis of each key

59h~60h KEY0~KEY7 On Debounce Register (RW)

Bit	D7:D0
Name	DEBOUNCEx[7:0]
Default	0000 0010

DEBOUNCEx De-bounce number of each key. When the acquired number $>$ de-bounce setting value, then the key is granted as on.

61h Key Interrupt Enable Register (RW)

Bit	D7:D0
Name	INTEN[7:0]
Default	0000 0000

The Interrupt Enable Register determines whether a key is detected and it causes the interrupt pin to be asserted.

INTEN Key Interrupt Enable
0 Disable
1 Enable

The default value for Interrupt Enable Registers is interrupt disable. Setting INE bit of Interrupt Configuration Register (69h) to "1", INT pin will generate interrupt signal.

76h Lock Scan Cycle Register (RW)

Bit	D7:D0
Name	LSC[7:0]
Default	0000 1000

LSC Lock Scan Cycle
Ignore the key scan data for the setting Lock scan cycle if the |raw count – baseline| > Lock threshold.

77h Raw Count Difference Limit Register (RW)

Bit	D7:D0
Name	RCDL[7:0]
Default	0110 0100

RCDL Raw Count Difference Limit
Ignore the key scan data if the difference between previous raw count and current raw count exceeds the limit.

78h Multiple Touch Key Configure Register (RW)

Bit	D7:D2	D1:D0
Name	-	MTK[1:0]
Default	000000	01

MTK Multi Touch Key
 00 Allow all keys to be triggered at one time.
 01 Allow one key to be triggered at one time.
 10 Allow two keys to be triggered at one time.
 11 Allow three keys to be triggered at one time.

RPT Repeat Sequence Count
 00 No repeat
 01 Repeat 4 times
 10 Repeat 8 times
 11 Repeat 16 times

INI Initial Setting Delay
 INI[1-0] defines the number of TKCLK periods for the initial settling of pin Cref. The delay is (INI[1-0] + 1) * 4 * TKCLK.

ASTDLY Auto Mode Start Delay
 ASTDLY[1-0] inserts an inter-sequence idle time of (ASTDLY[1-0] + 1) * 256 TKCLK at each sequence start. This delay allows the stabilization time from normal mode to sleep mode.

LFNF Low-Frequency Noise Filter Setting
 00 disable LFNE
 If the scan count with noise injection detection is larger than (LFNF[1-0] * 8), the scan result is ignored.

Bit	D7	D6	D5:D4	D3:D0
Name	PUDIEN	PUDREN	-	PUD[3:0]
Default	0	0	00	0000

TK3PUD is to configure a constant DC pull-up/pull-down on pin Cref to allow high capacitance touch-key detection. A DC pull-up/pull-down can compensate for the equivalent resistance which is caused by a high capacitance key. Connecting a constant current source or resistor can thus maintain touch key detection sensitivity. In general, we will try to maintain the raw count around half of CCNT for the case without key touched.

For DC current, PUD[3:0] enables 8uA/4uA/2uA/1uA current source. For Resistor, PUD[3:0] enables 5K/10K/20K/40K resistor.

8Ah Spread Spectrum Register (RW)

Bit	D7:D2		
Name	SSR[3:0]	SSA[1:0]	-
Default	0000	11	-

SS	Spread Spectrum Setting With spread spectrum technique, electromagnetic energy produced over a particular bandwidth is spread in the frequency domain, and that can reduce EMI. Two parameters are listed as follows:
SSR[3:0]	Defines the spread spectrum sweep rate. If the SSR[3:0] =0, then spread spectrum is disabled.
SSA[1:0]	Defines how to adjust the spread spectrum frequency bandwidth. The frequency is adjusted by adding SSA [1:0] range to the actual internal OSC control register.

08h Buzzer Register (W)

Bit	D7:D0											
Name	BW											
Default	0000 0000											

Write melody data, stop melody play and clear the FIFO

08h Buzzer Register (R)

Bit	D7:D0											
Name	BR											
Default	0000 1010											

BR Buzzer Register Read. It shows the available tone buffer size. SE5118A has 10 built-in note buffers.

I²C command format - Each node is composed of 4 byte data and the incomplete note will be ignored. The incoming note data will be ignored when the FIFO is full.

0x78, 0x07, (Sid, Tt, Tw, Tp), (Sid, Tt, Tw, Tp),

0x78, 0x07, 0xFF stops the melody play and clear the FIFO.

0x78, 0x07 Set the register number 0xF0.

0x79 Read FIFO's remaining length.

8. Typical Application Information

8.1 General Description

The IS32SE5118A is an ultra-low power, fully integrated 8-channel solution for capacitive touch-buttons applications. The chip allows electrodes to project sense fields through any dielectric material such as glass or plastic.

8.2 Sensitivity Adjusting

Sensitivity can be adjusted by the external capacitor or internal register. A higher capacitor value will yield out lower detect sensitivity. A lower capacitor value will yield out higher detect sensitivity.

8.3 Interrupt

Touch key detection event will trigger INT pin. The INT pin will be driven low when the selected channel is pressed.

8.4 Sleep Mode

IS32SE5118A can be put in sleep mode to save power consumption and the device can be woken up by touching the selected keys. For the detailed application, please refer to Section 3.8 Generate Sample Code of Lumissil application note "IS31SE5118A Eval Board User's Manual".
